

AICURE DOSING SUPPORT, ADHERENCE, AND INSIGHTS

The AiCure platform offers robust data and insights by combining data from dosing support, adherence & insights, digital biomarkers, and ePRO. The ability to curate data streams and provide dosing insight enables a holistic view of a patient's symptoms and informs decisions about safety and efficacy results.

Visually confirm when medication is taken or missed. An in-depth understanding of dosing behavior lets sponsors help patients maintain treatment regimens. Sites can connect with patients via chat, text, and video to strengthen relationships, understand the context of care, and better assess issues that might impact study conduct.

POWERFUL SAFETY AND EFFICACY INSIGHTS CAPTURED WITH DOSING AND MEDICATION ADHERENCE SOFTWARE

An easy-to-use application available on a personal device or a provisioned device sends alerts and reminders to help the participant adhere to the protocol. The dose event is visually confirmed, and sites have a real-time view of adherence, which allows for targeted outreach and intervention. In the case of intentional non-adherence, sites and sponsors can conduct additional checks and flag patient behavior.

Additionally, AiCure offers a caregiver's feature, as well as AiCure Patient Connect™, to enable better connections between sites and patients using text, talk, and video chat.

AICURE IMPROVES MEDICATION ADHERENCE

In a study, the impact of outpatient adherence interventions in individuals with schizophrenia, the adherence with AiCure was significantly higher than with no intervention, with text reminders and also higher than with observed dosing in-clinic.
